## Software Engineering

# (Domain) Modeling

- Resources:

Craig Larman; Applying UML and Patterns: An Introduction to Object-Oriented Analysis and Design and the Unified Process; Prentice Hall, 2001

TECHNISCHE  
UNIVERSITÄT  
DARMSTADT

# Domain Model

---

- Why:

Domain modeling helps us to *identify the relevant concepts and ideas of a domain.*

- When:

Whenever we need to understand the (further) concepts in a domain.

- Guideline:

Only create a domain model for the tasks at hand.

TECHNISCHE  
UNIVERSITÄT  
DARMSTADT

“**Curtis’law:** [...] Good designs require deep application knowledge.”

Sinngemäß: “Ein guter (Software-)Entwurf benötigt ein tiefgreifendes Verständnis des Einsatzgebiets (der zu erstellenden Software.)”

---

Albert Endres and Dieter Rombach  
A Handbook of Software and Systems Engineering; Addison Wesley 2003

# The Domain Model illustrates noteworthy concepts in a domain.

Domain Model =dt. Analysemodell (Konzeptmodell)

Domain Model | 4

- The domain model is created to decompose the domain into concepts or objects in the real world
- The model should identify the set of conceptual classes  
(The domain model is iteratively completed.)
- It is the basis for the design of the software

The domain model is also called conceptual model, domain object model or analysis object model.

- Conceptual classes are ideas, things or objects in the domain  
A conceptual class has a symbol representing the class, an intension and an extension that defines the set of examples to which the conceptual class applies.  
*intension =dt.(hier) Bedeutung*  
*extension =dt.(hier) Ausprägung*
- Domain concepts / conceptual classes are not necessarily software objects as, e.g., in Java, C#, Ruby, ...!

# Visualizing Domain Models

---

- Exemplified  
(By means of a basic course management system.)

TECHNISCHE  
UNIVERSITÄT  
DARMSTADT

To visualize domain models the UML class diagram notation is used.

- However, **no operations** are defined in domain models
- Only ...
  - domain objects and conceptual classes
  - associations between them
  - attributes of conceptual classes

The result is a conceptual perspective model.

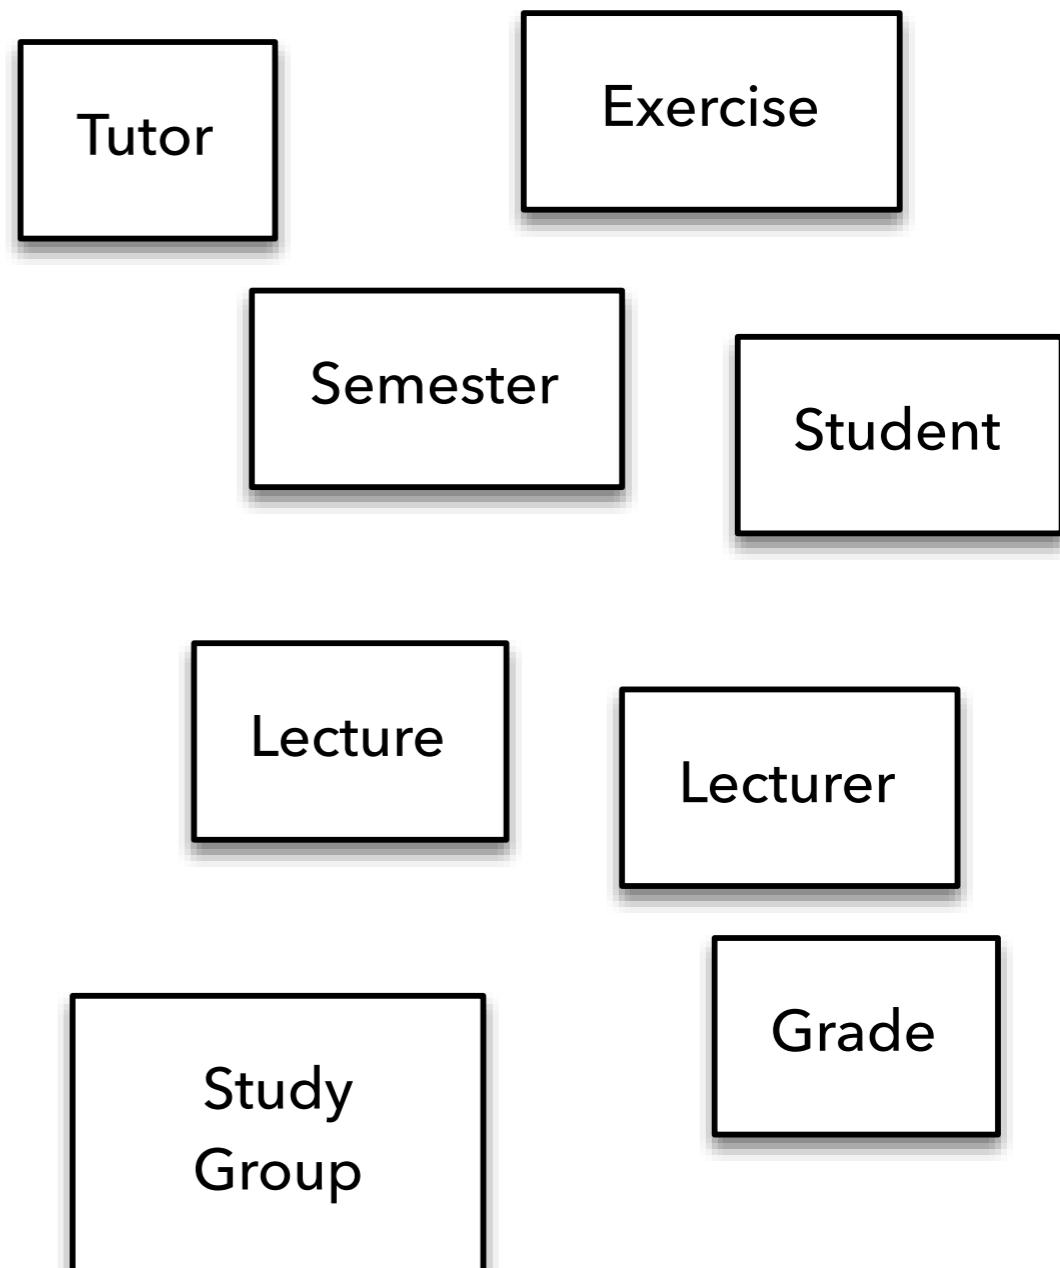

# Statements about a Course Management System

- During a semester a lecturer reads one or more lectures
- Sometimes the lecturer is on leave to do research, in this case (s)he does not give a lecture
- A student usually attends one or more lectures, unless (s)he has something better to do
- During the semester there will be several exercises which are meant to be solved by small study groups
- Each student is assigned to one particular study group for the whole semester
- A study group consists of two to three students
- After submission of a solution by a study group it is graded by a tutor
- ...

A class describes a set of objects with the same semantics, properties and behavior.

When used for domain modeling, it is a visualization of a real world concept.

- During a semester a lecturer reads one or more lectures
- A student usually attends one or more lectures, ...
- During the semester there will be several exercises...
- Each student is assigned to one particular study group for the whole semester
- ... it is graded by a tutor

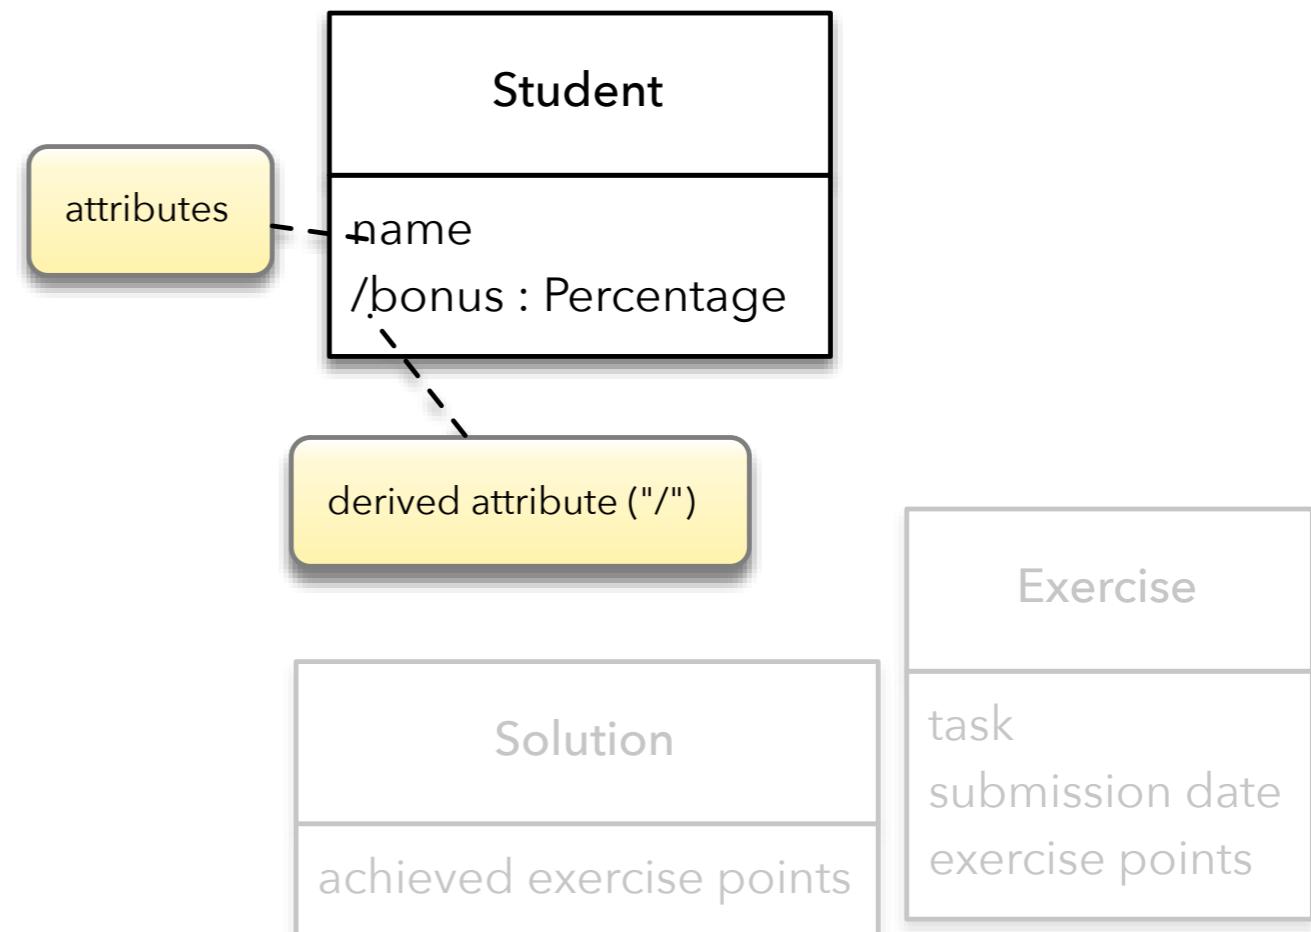

# Attributes are logical data values of an object.

It is useful to identify those attributes of conceptual classes that are needed to satisfy the information requirements of the current scenarios under development.

Visualizing the Domain Model | 10

- ... after submitting a solution it is graded by a tutor
- The bonus is **a relative bonus** that reflects the relative number of exercise points gained during the semester
- The bonus is derived.

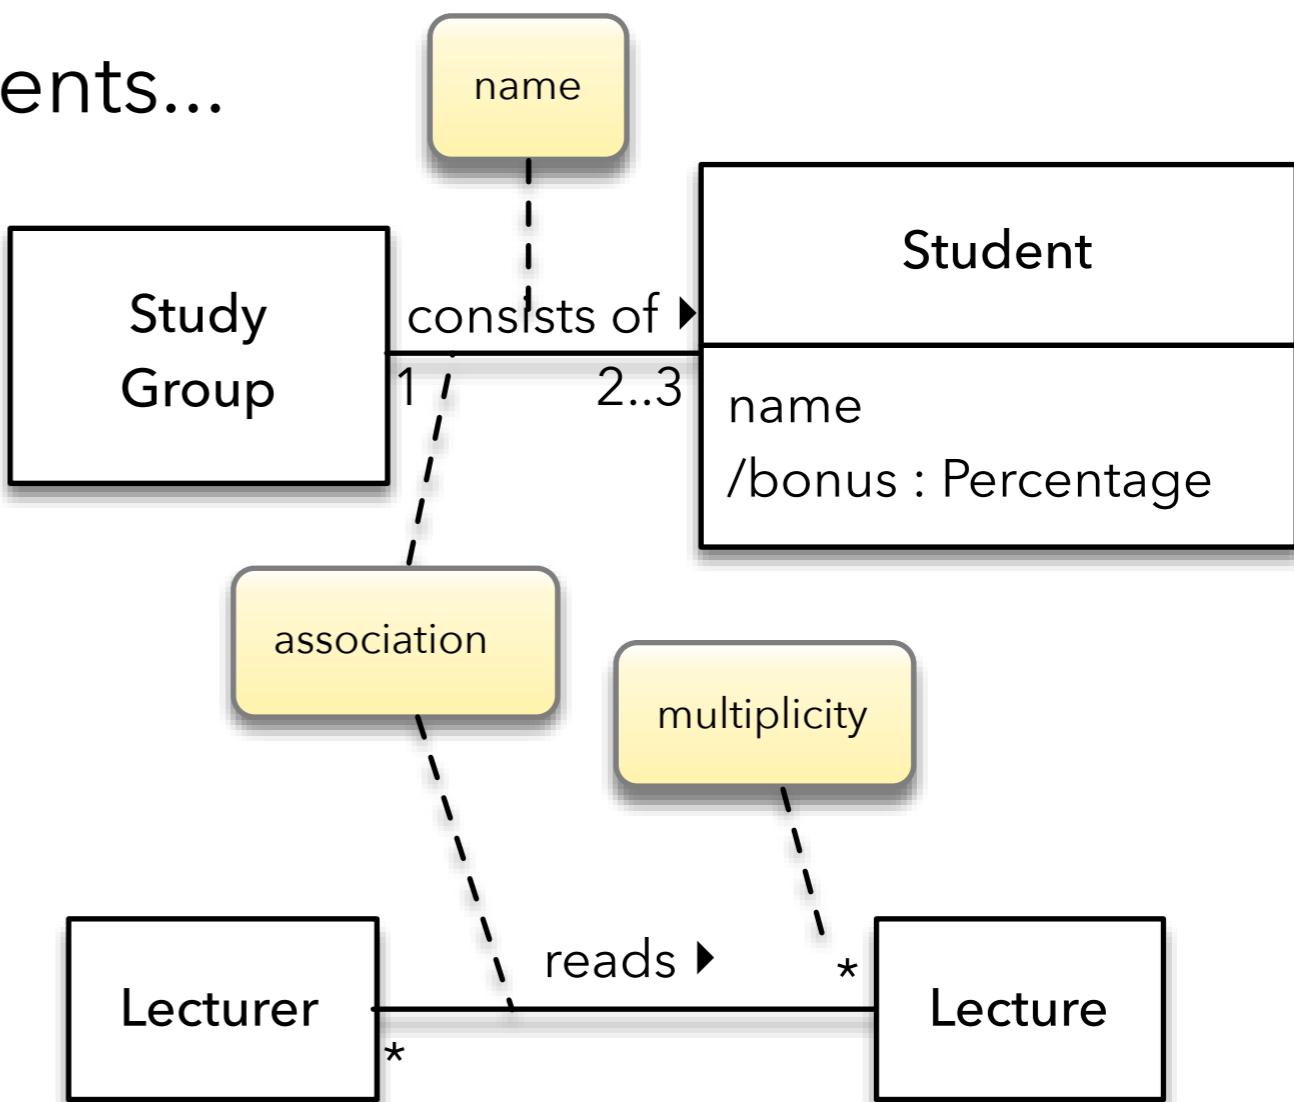

# An association is a relationship between classes.

The ends of an association are called roles.

Roles optionally have a multiplicity, name and navigability.

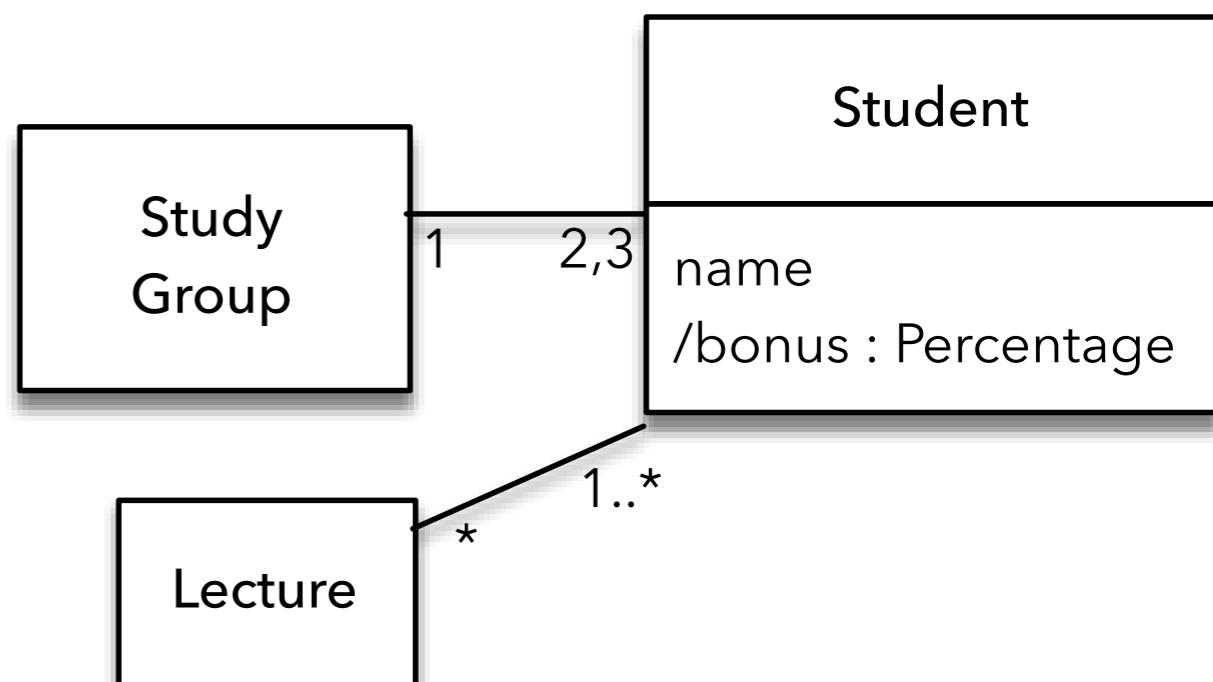

- A lecturer **reads** lectures...
- A study group **consists of** students...
- ...

The multiplicity defines how many instances of a class A can be associated with one instance of a class B at any particular moment.  
(e.g., \*  $\triangleq$  zero or more; 1..10 between 1 and 10; 1,2 one or two)

Visualizing the Domain Model | 12

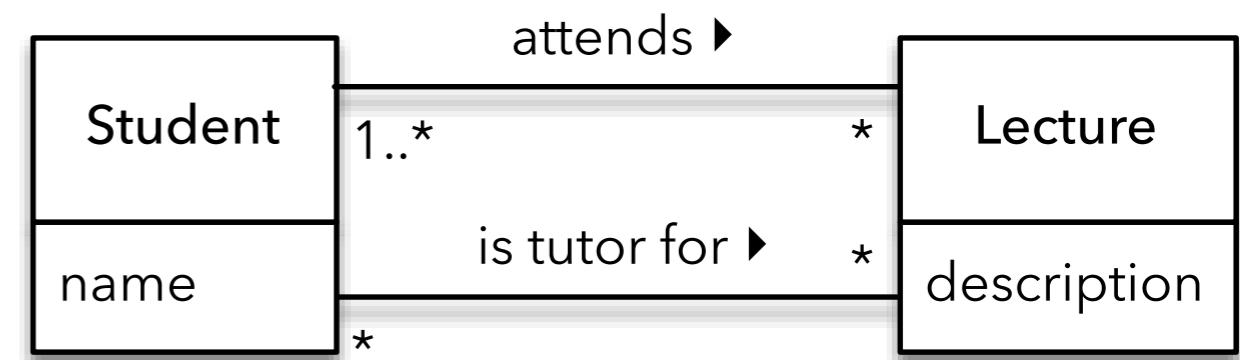

- A student usually attends **one or more** lectures, unless (s)he has something better to do
- A study group consists of **two to three** students...
- ...

# Two classes can have multiple associations.

Visualizing the Domain Model | 13

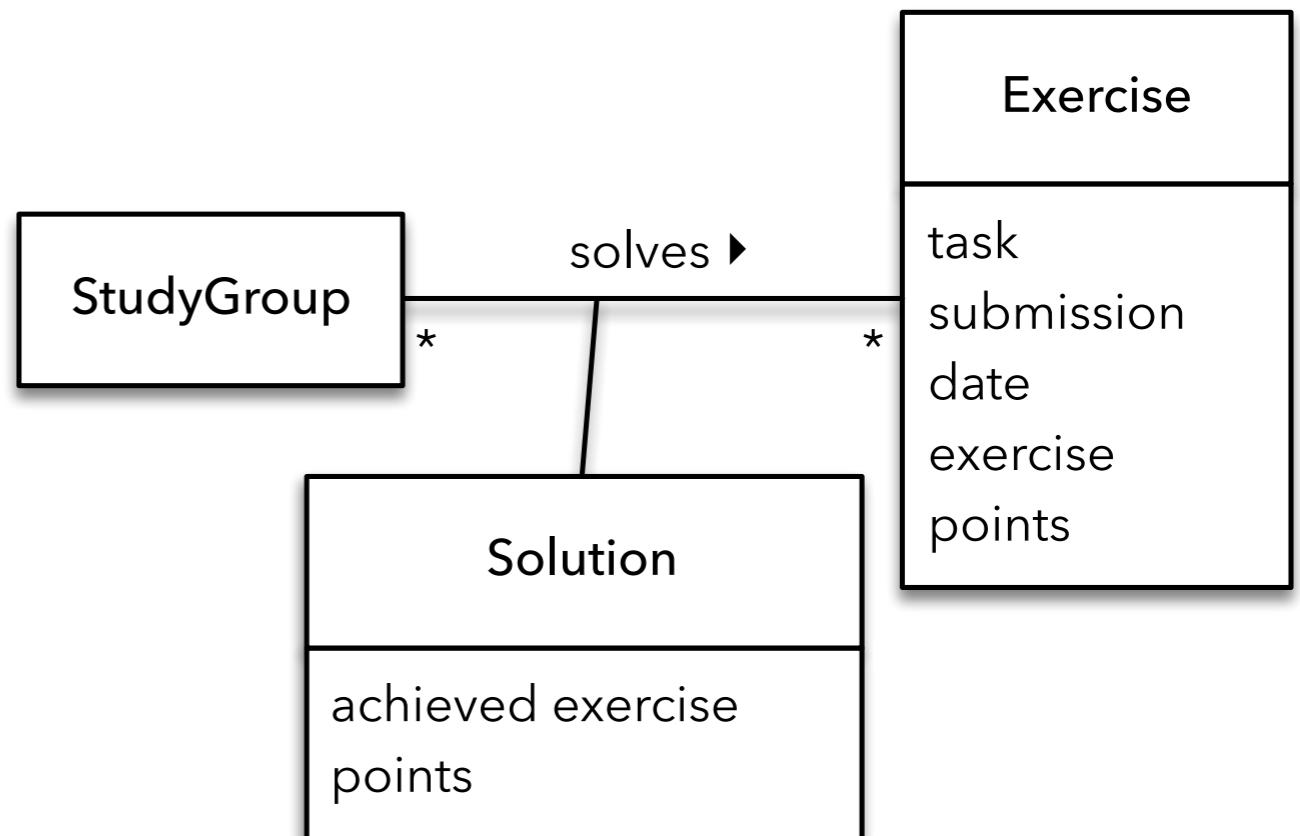

- A student usually attends one or more lectures, unless the student has something better to do
- A study group consists of two to three students; after submitting a solution it is graded by a tutor for the lecture. The tutor is also a student

# An association can have their own classes.

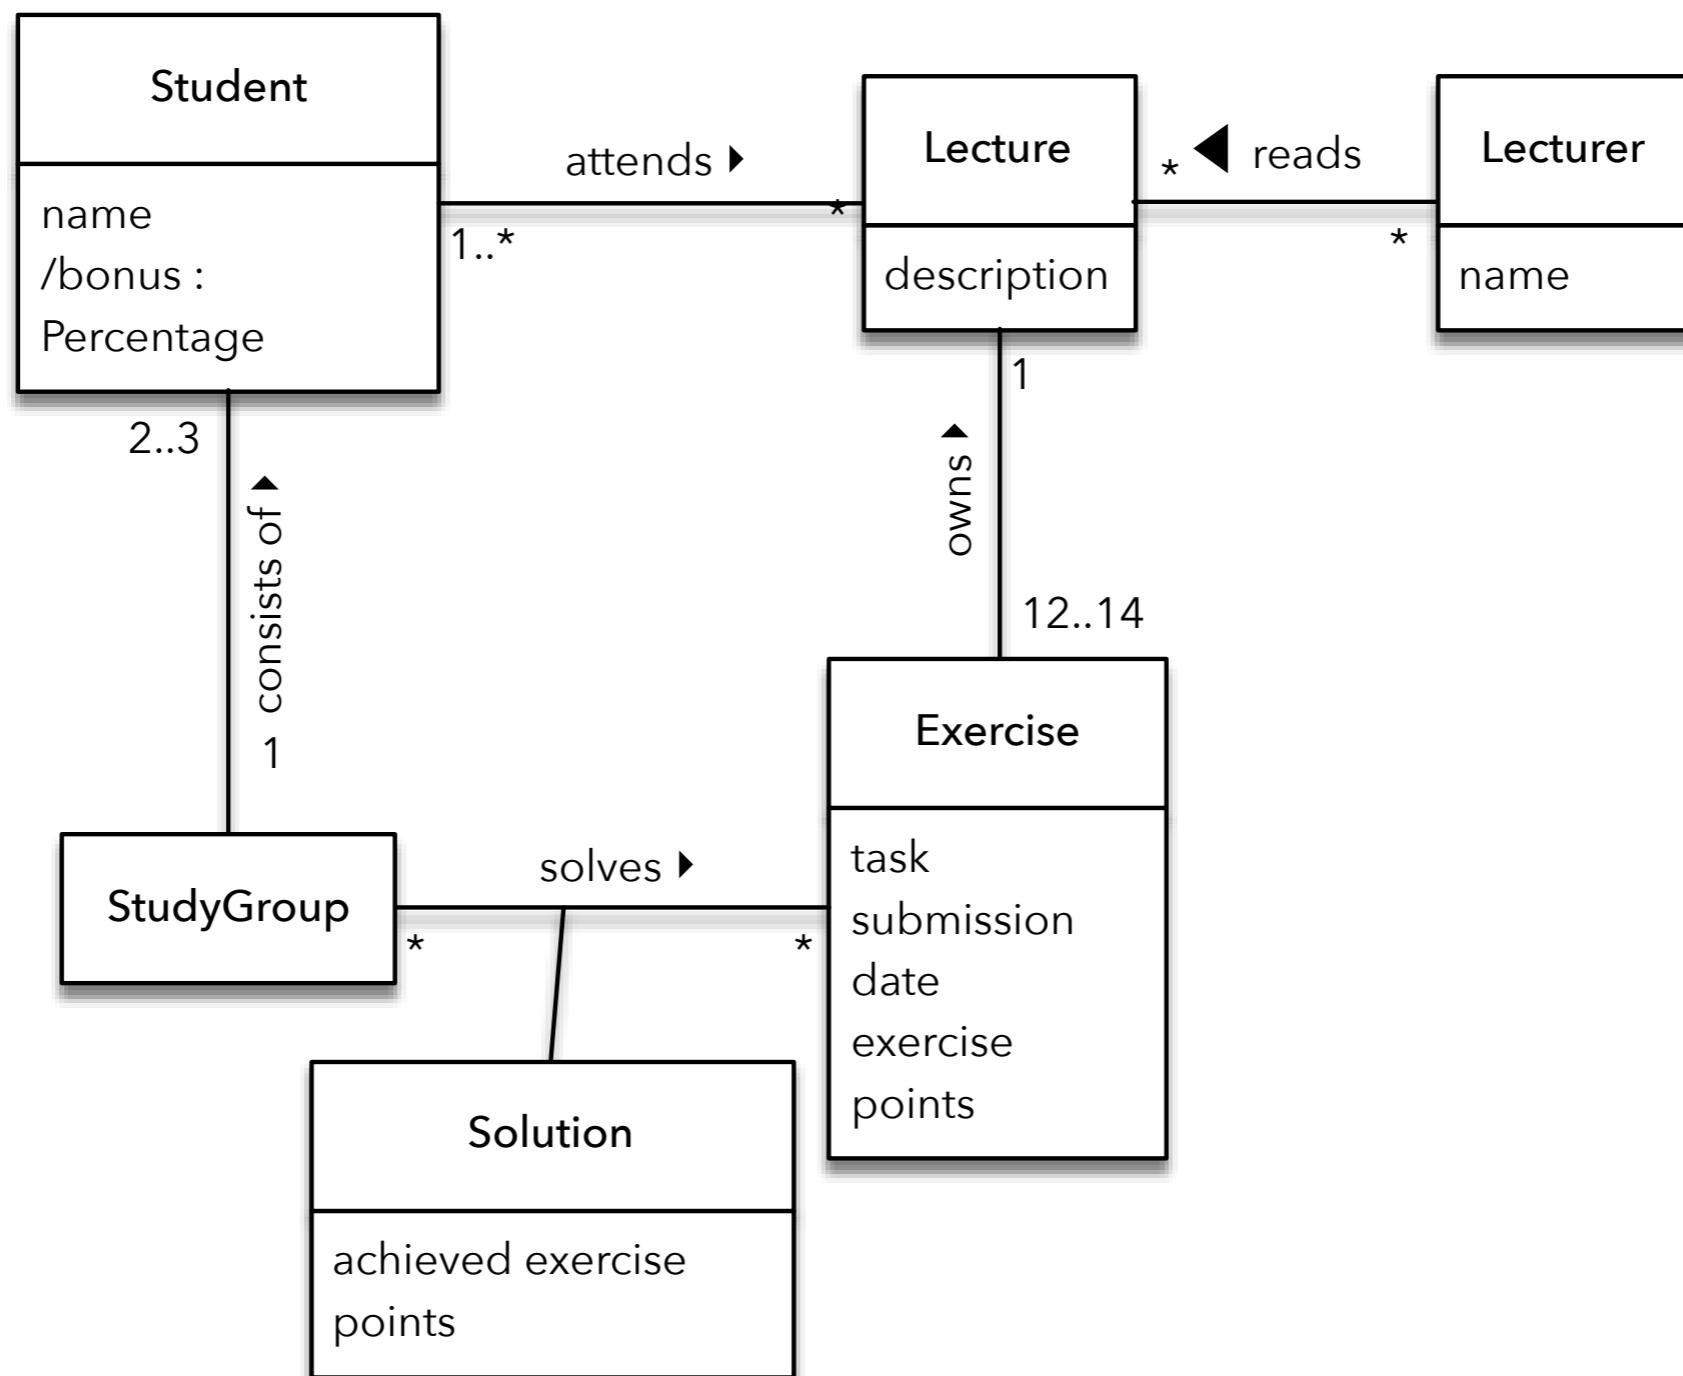

Visualizing the Domain Model | 14

- A study group can submit a solution which is then graded by a tutor or assistant

# A preliminary domain model for a course management system.

# Domain Modeling

---

- Overview

TECHNISCHE  
UNIVERSITÄT  
DARMSTADT

# Excerpt Of the Domain Model For the POS System

Which are noteworthy  
domain concepts / domain objects?

# How to create the domain model?

(If we are not readily familiar with the domain.)

## 1. Find the conceptual classes

Strategies:

- a. *Reuse or modify an existing model*
- b. *Use a category list*
- c. *Identify noun phrases*

explained in  
the following

## 2. Draw them as classes in a UML class diagram

## 3. Add associations and attributes

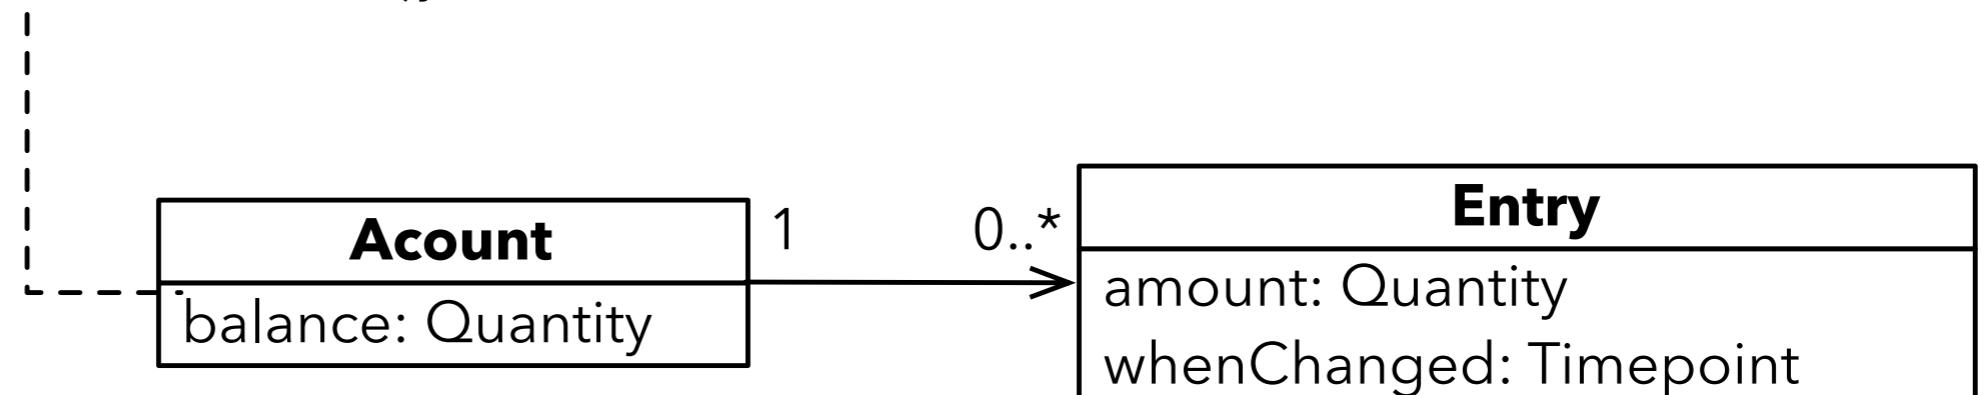

Use the domain vocabulary; e.g. a model for a library should use names like "Borrower" instead of customer.

# How to create the domain model?

To find the conceptual classes reuse or modify an existing model.

Example: existing model for bank accounts and associated entries.

{balance = sum(entries.amount)}

[One possible source]

Martin Fowler; Analysis Patterns - Reusable Object Models; Addison-Wesley, 1997

# How to create the domain model?

Use a category list to find the conceptual classes.

line item = dt. Einzelposten

transaction = dt. Abwicklung / Durchführung; Geschäftsvorfall

Conceptual Class Category	Classes (for the POS system)
Business transactions...	Sale, Payment
Transaction line items...	SalesLineItem
Product or service related to a transaction or transaction line item.	Item
Where is the transaction recorded?	Register
Roles of people or organizations related to the transaction; actors in use cases.	Cashier, Customer, Store
Place of transactions.	Store
Noteworthy events, often with a time or place that needs to be remembered.	Sale, Payment
...	...

# How to create the domain model?

## Identify noun phrases to find the conceptual classes (linguistic analysis).

Domain Modeling | 21

- Identify the nouns and noun phrases in textual descriptions of a domain and consider them as candidate conceptual classes or attributes
- A mechanical noun-to-class mapping isn't possible; words in natural languages are ambiguous; i.e. the same noun can mean multiple things and multiple nouns can actually mean the same thing

"Use Cases" are also an excellent source for identifying conceptual classes.

# How to create the domain model?

Identify noun phrases to find the conceptual classes.

Process Sale: A customer arrives at a checkout with items to purchase. The cashier uses the POS system to record each item. The system presents a running total and line-item details. The customer enters payment information, which the system validates and records. The system updates the inventory. The customer receives a receipt from the system and then leaves the store with the items.

Identify noun phrases to find the conceptual classes.

Process Sale: A customer arrives at a checkout with items to purchase. The cashier uses the POS system to record each item. The system presents a running total and line-item details. The customer enters payment information, which the system validates and records. The system updates the inventory. The customer receives a receipt from the system and then leaves the store with the items.

# How to create the domain model?

Identify noun phrases to find the conceptual classes.

Process **Sale**: A customer arrives at a checkout with items to purchase. The cashier uses the POS system to record each item.

Identified candidate conceptual classes:

**Customer, Item, Cashier, Store, Payment, Sales Line Item, Inventory, Receipt, Sale.**

inventory. The customer receives a receipt from the system and then leaves the store with the items.

# How to create the domain model?

Identify noun phrases to find the conceptual classes.

Process **Sale**: A customer arrives at a checkout with items to purchase. The cashier uses the POS system to record each item.

Identified candidate conceptual classes:

**Customer, Item, Cashier, Store, Payment, Sales Line Item, Inventory, Receipt, Sale.**

inventory. The customer receives a receipt from the system and then leaves the store.

Should Receipt be in the domain model?

# Guidelines when to include a candidate conceptual class that reports Information into the domain model

Domain Modeling | 26

- In general, it is not useful since all information is derived or duplicated from other sources
- If it has a specific semantics w.r.t. the business, then it should be included

Identified candidate conceptual classes:

**Customer, Item, Cashier, Store, Payment,  
Sales Line Item, Inventory, Receipt, Sale.**

Should Receipt be  
in  
the domain model?

# Guidelines when to include a candidate conceptual class that reports Information into the domain model

Domain Modeling | 27

- In general, it is not useful since all information is derived or duplicated from other sources
- If it has a specific semantics w.r.t. the business, then it should be included

Identified candidate conceptual classes:

**Customer, Item, Cashier, Store, Payment,  
Sales Line Item, Inventory, Receipt, Sale.**

A receipt is just a report of  
a sale and a payment...

# Guidelines when to include a candidate conceptual class that reports Information into the domain model

Domain Modeling | 28

- “Facts”:
  - Identified candidate conceptual classes: ... Receipt, ....
  - A receipt is just a report of a sale and a payment...
- Should Receipt be in the domain model?
- Well, it depends....
  - ... if we just consider the current scenario then receipt should not be part of the domain model; a receipt is just a report
  - ... if we also consider how to handle returns then a receipt represents an important concept on its own
- How about legal restrictions...?

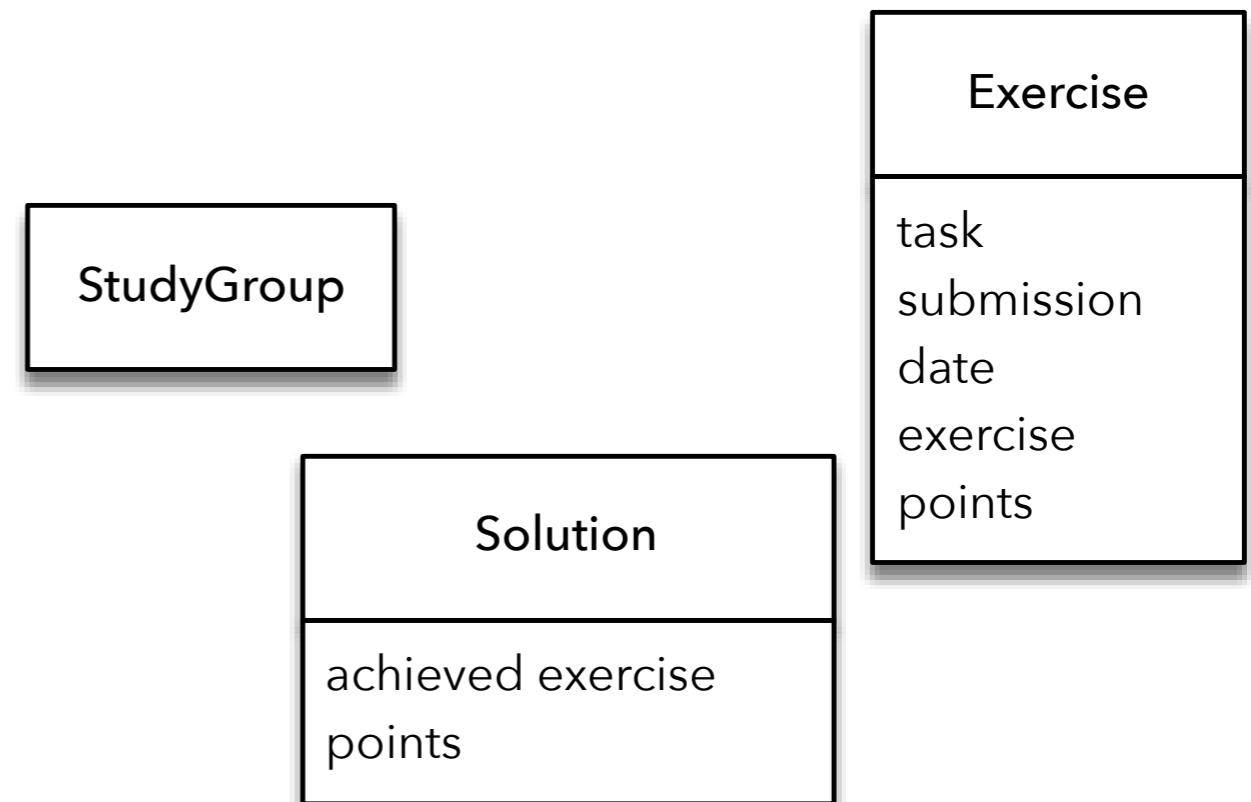

Domain  
Requirement

# When should I model something as an attribute or a class?

Domain Modeling | 29

- Rule of Thumb:

If we do not think of some conceptual class X as a number, date or text in the real world, X is probably a conceptual class, not an attribute.

# When should I add an association to the domain model?

Domain Modeling | 30

- Rule of Thumb:

Include associations in the domain model for which knowledge of the relationship needs to be preserved for some duration.

We are working on the conceptual model; we are not modeling associations at the software level.

# When should I add an association to the domain model?

Domain Modeling | 31

---

- When an association is among the common associations list:
  - A is a transaction related to another transaction B
  - A is a line item of a transaction B
  - A is a product or service for a transaction B
  - A is a role related to a transaction B
  - A is a physical or logical part of B
  - ...

# When should I add an association to the domain model?

Domain Modeling | 32

---

- E.g. the relation between a **Sale** and a **SalesLineItem** needs to be remembered
- However, it is not necessary to store the relation between a **Cashier** and a **ProductDescription** that he looks up

# Name an association based on a ClassName-VerbPhrase-ClassName format.

The verb phrase creates a sequence that is readable and meaningful.

- Good examples:
  - Player *Is-on* Square
  - Sale *Paid-by* CashPayment
- Bad examples:
  - Sale *Uses* CashPayment  
("Uses" is usually generic and doesn't tell us anything.)
  - Player *Has* Square  
("Has" is usually generic and doesn't tell us anything.)

The attributes in a domain model should preferably be “primitive” data types w.r.t. the domain.

Domain Modeling | 34

- Very common data types include: Boolean, Date, Number, Character, String, Address, Color, Phone Number,

...

- Consider modeling quantities as classes to be able to associate units  
e.g. the data type of the amount attribute of a payment should indicate the currency

Cashier
name
currentRegister

# The attributes in a domain model should preferably be “primitive” data types.

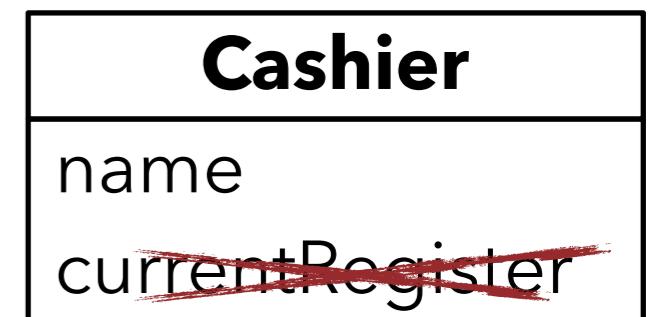

Domain Modeling | 35

- Very common data types include: Boolean, Date, Number, Character, String, Address, Color, Phone Number,

...

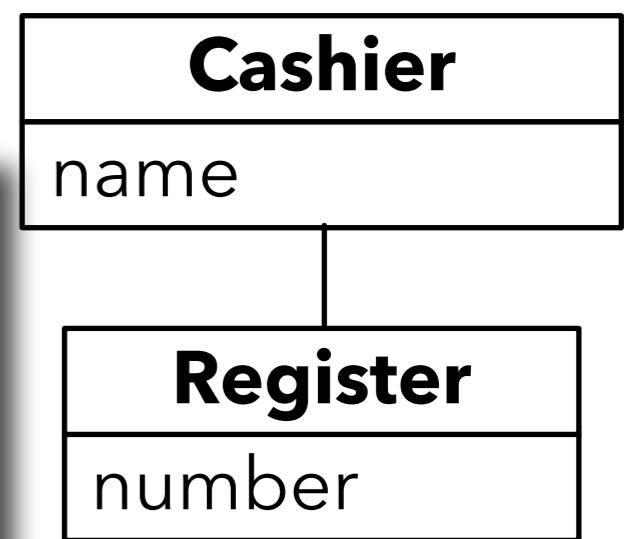

- Consider modeling quantities as classes to be able to associate units  
e.g. the data type of the amount attribute of a payment should indicate the currency

avoid:

recommended:

Use associations to model dependencies between conceptual classes; do not use attributes.

# Consider defining a new data type class for something that is initially considered a string.

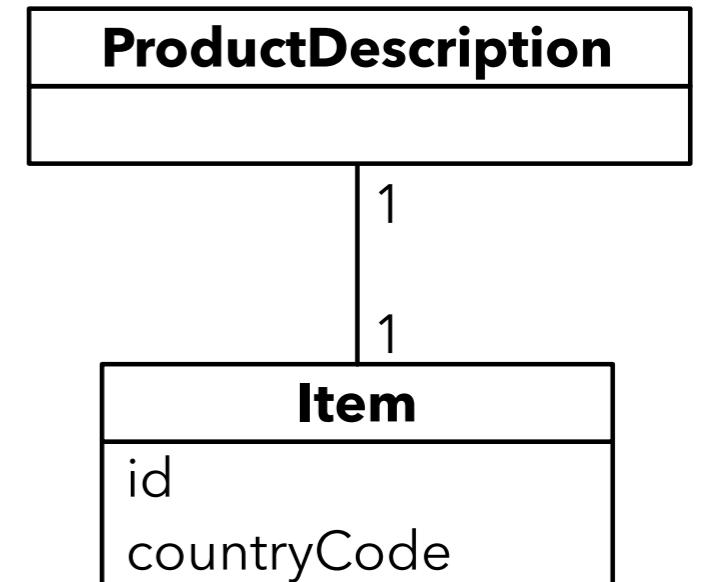

Domain Modeling | 36

- If the string is composed of separate sections  
e.g., phone number, name of person,...
- If different operations are associated with the string  
e.g., social security number
- If the string has other attributes
- If the string is a quantity with a unit  
e.g., money has a unit for currency

avoid:

recommended:

domain concepts / domain objects?

# Excerpt Of the Domain Model For the POS System

# Domain Model and Domain Modeling

---

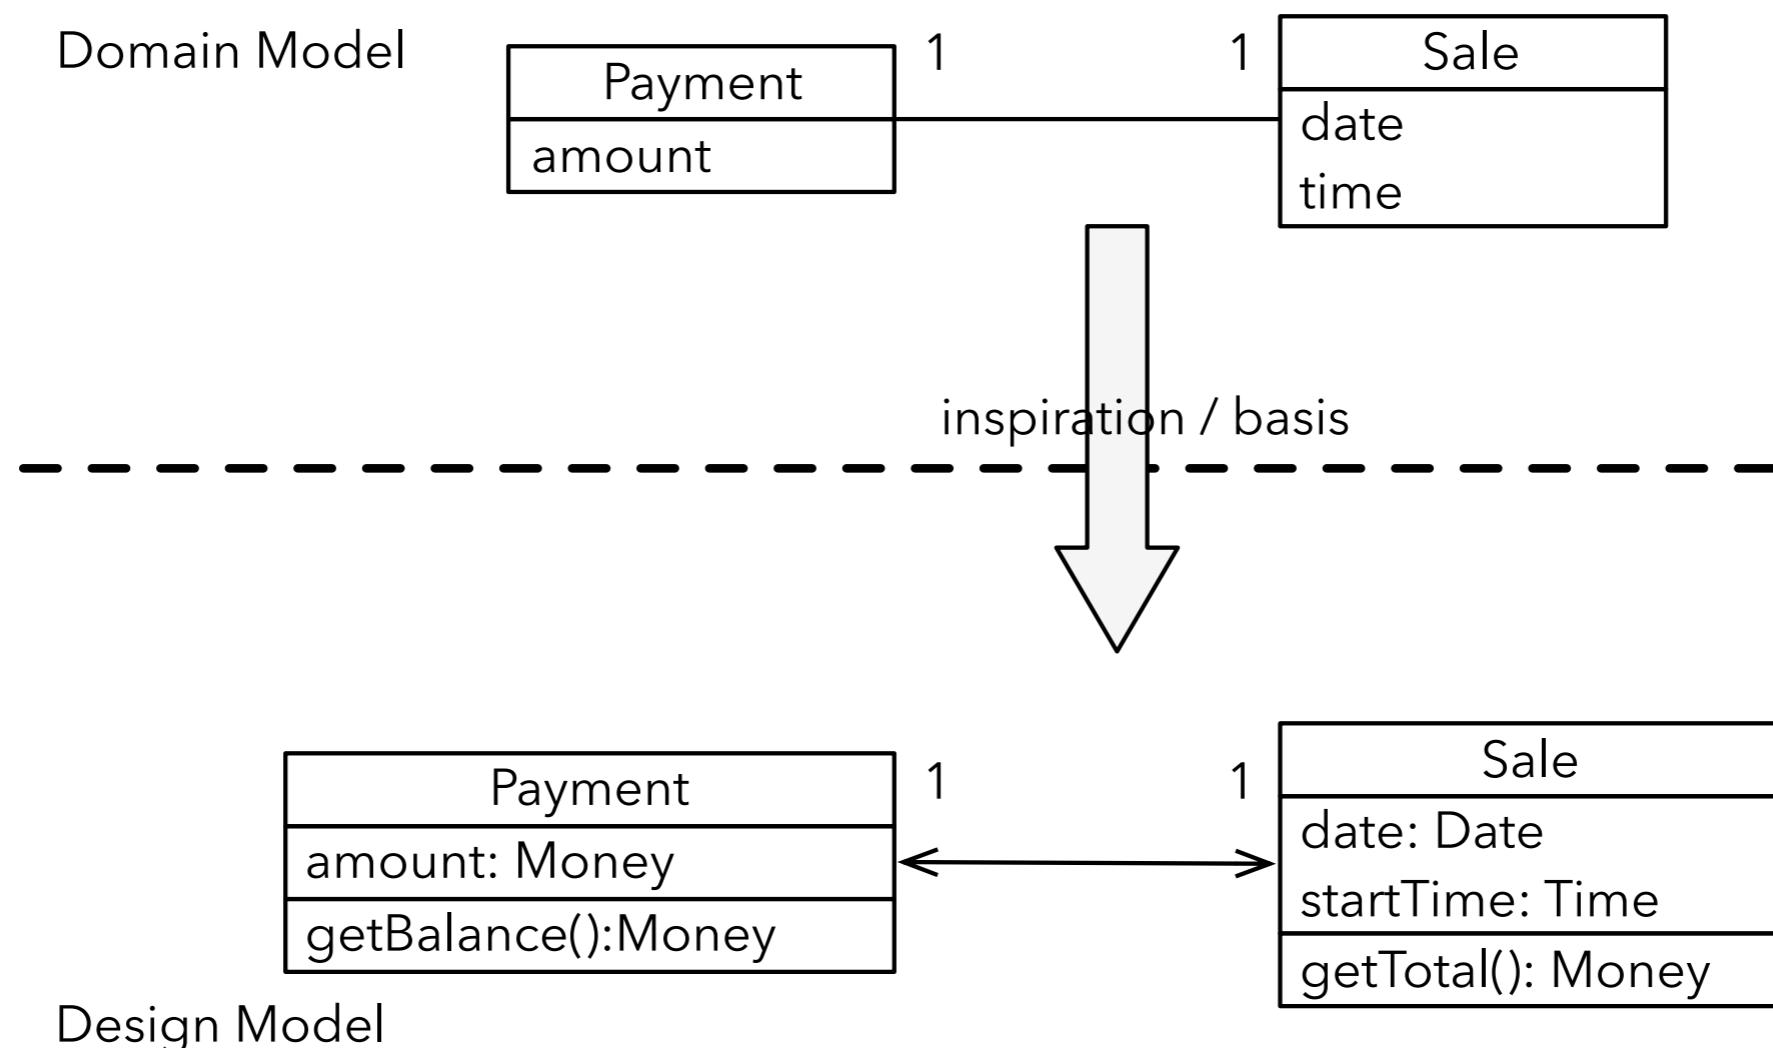

- Summary

TECHNISCHE  
UNIVERSITÄT  
DARMSTADT

The domain model serves as a source of inspiration for the design model which will be discussed later on.

Purpose of Domain Modeling | 40

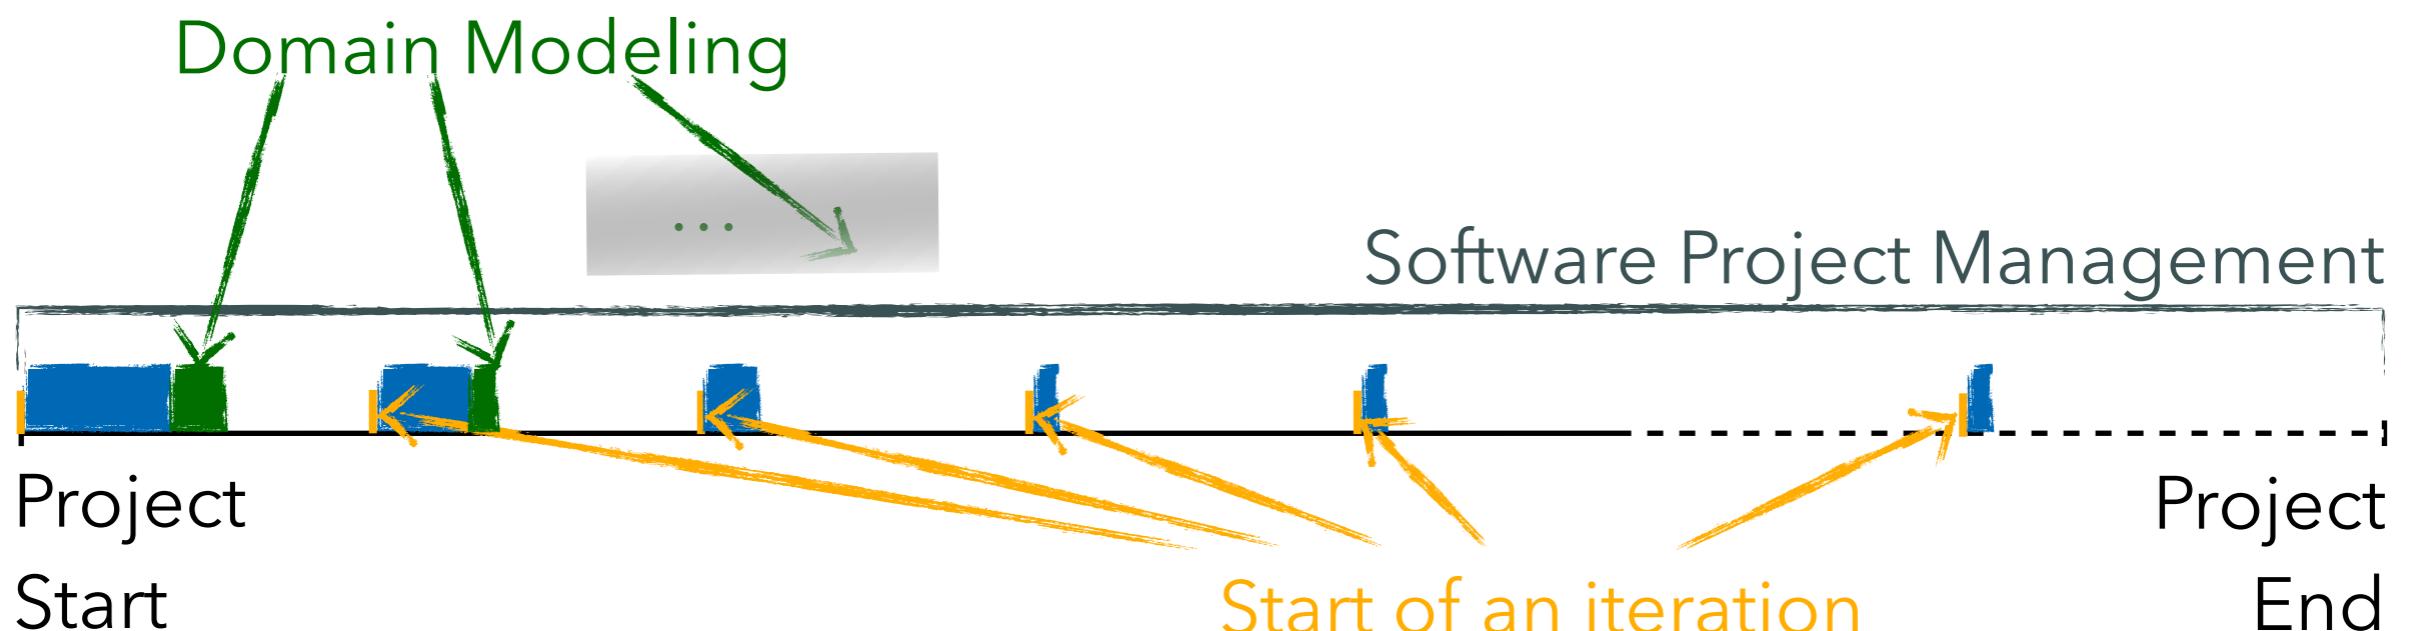

By using the domain model as a direct inspiration for software classes the representational gap between the domain concepts and the program is (relatively) small.

---

The goal of this lecture is to enable you to systematically carry out small(er) software projects that produce well-designed software.

- 
- **Domain Modeling** is useful to understand the ideas and concepts of the domain and their interrelationships
  - A **Domain Model** is usually created at the beginning of a project and is a basis for the design model
  - A **Domain Model** is created using a subset of the UML class diagram notation

- The goal of this lecture is to enable you to systematically carry out small(er) commercial or open-source projects.
